Subject: Perfluorinated Compound Removal (PFOA/PFOS)

Greetings,

Perfluorinated compounds (PFCs) have recently been given a "Health Advisory Risk" limit by the USEPA of 70ppt. The elevation of their status from simply an unregulated contaminant to be monitored voluntarily to a contaminant that requires action to be taken has left a number of communities scrambling to protect their water supply. As PFCs have been linked to obesity, high cholesterol, and some types of cancers, many communities are looking for reliable, proven, and quick solutions to this emerging threat.

Calgon Carbon has been in water treatment for over fifty years and has been treating many types of PFCs including PFOS, PFOA, and PFbA for the last fifteen years. During that time we have learned that Granular Activated Carbons (GAC) is the most cost-effective means to remove these toxins from the water supply. A properly designed GAC barrier can not only remove the toxins, but our reactivation process removes the toxins completely from your water and does not generate a super-saturated waste stream that needs to be addressed while providing a fully recyclable carbon to cut system operating costs.

Attached you will find a short informational brochure on our PFC removal solutions, providing an immediate means to eradicate the harmful toxins from your water supply. No one packet can cover every possible water treatment system design, so please contact 1-800-4CARBON or visit our website: www.calgoncarbon.com in order to get more information on how we can design and size a GAC filter for the needs of your application.

Best Regards,

Doug Conley
